(Notes) Compose and Pipe

Question: What is the purpose of the compose and pipe functions in JavaScript?

Explanation:

- **compose** and **pipe** are higher-order functions used for function composition in JavaScript.

- **compose** takes multiple functions as arguments and returns a new function that applies these functions from **right to left**.

- **pipe**, on the other hand, applies the functions from **left to right**.

- Both **compose** and **pipe** are commonly used in functional programming to create new functions by combining existing ones in a specific order.
